REPORT TYPE

SEO Audit &
Findings Report

Executive Summary

What we found, why it matters, and what it is costing you.

The short version: The Roof Xperts has the two things that are hardest to build — a licensed, 30-year operating history (CGC1536478 / CCC1331579) and genuinely excellent review scores (4.9 Angi, 4.9 HomeAdvisor, 5.0 Yelp, BBB-accredited since 2019). What it does not have is a web presence capable of converting any of that into search rankings.

The brand is currently running **two separate websites**, is listed at **at least four different street addresses** across the directories Google uses to validate a local business, and has **no dedicated page** for any of the services it sells or any of the fifteen cities it claims to serve. In a market where competitors rank on purpose-built city and service pages, that is the difference between appearing in the map pack and being invisible.

The single most expensive problem

A second live website — `trx.company` , branded "The Roof Xperts Co" — is indexed by Google alongside `theroofxperts.com` . It carries a different email address, a different page structure, and unfinished WordPress defaults visible in public search results. Every link, review mention, and brand search is being split across two domains, so neither one accumulates enough authority to rank. **Consolidating these is the fastest single win available.**

Scorecard

Grades reflect evidence gathered from search-engine indexes, directory listings, and public business records. See Section 02 for methodology and the items that require a direct site crawl to finalize.

LOCAL SEO / MAP PACK F NAP conflicts across 4+ addresses, duplicate directory profiles, conflicting hours.	SITE ARCHITECTURE F Brand split across two domains. No service or location page layer.	ON-PAGE / METADATA D Duplicate and non-descriptive title tags; no geo or service modifiers.
CONTENT DEPTH F No blog, no cost guides, no insurance-claim content, no case studies.	STRUCTURED DATA F No evidence of LocalBusiness, Service, FAQ, or Review schema in results.	REPUTATION ASSETS C+ Genuinely strong ratings — but fragmented, unconsolidated, and not on-site.
CREDENTIALS / E-E-A-T D Real licenses and 30-year history exist but are not surfaced where Google reads them.	CONVERSION DESIGN D 100% financing is a strong differentiator, buried on a secondary page.	BRAND / SOCIAL SIGNAL D 213 Instagram followers, 87 posts. No repurposing loop into the site.

What the market looks like

Your Broward competitors are not winning on craftsmanship — they are winning on infrastructure. Advanced Roofing leads with GAF Platinum Elite certification and a 35-year guarantee program. All Phase Construction runs dedicated URLs like `/locations/pompano-beach/best-roofers-pompano-beach` and leads with "HVHZ-certified, 2,500+ roofs." Clark Roofing leads with "70 years, 22,000 installations." Every one of those is a page structure and a set of trust signals you can match inside 90 days — you already have the licenses and the review scores to back it up.

Methodology & Scope

How this audit was produced, and what it does and does not cover.

What was examined

- Search-engine index coverage for `theroofxperts.com` and `trx.company` — which URLs are indexed, and the title tags and descriptions Google is displaying for them.
- Name / Address / Phone (NAP) data across Google-trusted directories: BBB, Yelp, Angi, HomeAdvisor, Yahoo Local, BuildZoom, ZoomInfo, Dun & Bradstreet, city-data business registry.
- Public business records: entity registration, EIN, and Florida DBPR contractor licensing.
- Review platform ratings, volume, and profile duplication.
- Social presence and content cadence.
- Competitive positioning of the top-ranking roofing contractors in Pompano Beach, Fort Lauderdale, and surrounding Broward markets.

Disclosure — crawl access

This audit was produced from a network environment that blocks direct HTTP access to third-party domains. **The site's raw HTML, headers, and page-speed metrics could not be fetched directly.** Every finding in Section 03 is therefore sourced from search-engine index data and public records, and each one cites its evidence.

Items that require a direct crawl to confirm are listed separately in Section 05 rather than asserted as findings. That crawl is the first deliverable of the Discovery phase — and in our experience it typically *adds* issues to this list rather than removing them.

Severity definitions

LEVEL	DEFINITION	RESPONSE TIME
CRITICAL	Actively prevents ranking or actively misleads Google about the business. Compounds daily.	Week 1–3
HIGH	Directly caps how much traffic the site can earn. No ranking ceiling breaks without fixing these.	Week 2–8
MEDIUM	Meaningful lift to conversion rate or competitive position, but not a blocker.	Week 6–16
TO VERIFY	Strongly suspected based on site age and structure; requires direct crawl to confirm and size.	Discovery

Business profile on record

FIELD	VALUE FOUND
Legal entity	The Roof Xperts LLC
EIN	82-3348191
Licenses	CGC1536478 (Certified General Contractor) · CCC1331579 (Certified Roofing Contractor) · NAT-F192684-1
Primary phone	(561) 740-5516
Primary email	Info@TheRoofXperts.com CONFLICT theroofoxpertsco@gmail.com (on trx.company)
Stated experience	30 years
Team size	1–10 employees
BBB	Accredited since 02/05/2019
Claimed service area	Fort Lauderdale, Lighthouse Point, Deerfield Beach, Pompano Beach, Davie, Weston, Boynton Beach, Pembroke Pines, Miami, Coral Springs, Parkland, Sunrise, Margate, Tamarac, Boca Raton

Note the last row. Fifteen cities are being claimed in directory descriptions. Zero of them have a corresponding page on the website. That gap is the core of the opportunity.

Critical Findings

Five issues that are actively preventing the site from ranking. Fix these first.

C-01 Two live websites are competing for the same brand

CRITICAL

EVIDENCE Both `theroofxperts.com` and `trx.company` ("The Roof Xperts Co") are indexed by Google. `trx.company` carries a full page set — `/services/`, `/roof-repair/`, `/residential-roofing/`, `/emergency-roofing/`, `/projects/`, `/process/`, `/about-us/`, `/contact/` — and a different contact email (`theroofxpertsco@gmail.com` vs `Info@TheRoofXperts.com`).

WHY IT HURTS

Google has to pick one domain to associate with "The Roof Xperts." Inbound links, citations, brand searches, and review mentions are split across both, so neither accumulates enough authority to compete. Worse, the two sites cannibalize each other for the same keywords — a self-inflicted duplicate-content problem.

THE FIX Pick one canonical domain (`theroofxperts.com` — it matches the brand, the email, and every directory citation). Map every `trx.company` URL to its best equivalent and 301-redirect it. Migrate any content worth keeping first. This consolidates all accumulated authority into one asset.

TIMELINE Week 1–2. Ranking response typically visible in 30–60 days.

C-02 Unfinished WordPress defaults are publicly indexed

CRITICAL

EVIDENCE Google is displaying the title tag `"Contact – My WordPress - The Roof Xperts Co"` and `"Emergency Roofing Services - My WordPress"` for `trx.company` pages — the WordPress installation's default site title was never changed. The default `/sample-page/` stub is also live and indexed.

WHY IT HURTS

Two problems. To Google, default placeholder content and orphaned stub pages are a quality signal — they indicate an unmaintained site, and unmaintained sites do not get ranked for commercial queries. To a homeowner about to spend \$12,000, seeing "My WordPress" in a search result for their roofing contractor is a credibility failure at the worst possible moment.

THE FIX Resolved by C-01. Once `trx.company` is redirected, these URLs stop existing. If any part of that site is retained short-term, the site title, all title tags, and the sample page need immediate correction and a re-crawl request.

TIMELINE Week 1. Same-day fix if `trx.company` must stay live temporarily.

C-03 At least four conflicting business addresses across the web

CRITICAL

EVIDENCE 1000 S Dixie Hwy W #8, Pompano Beach FL 33060 (own website) · 4699 N Federal Hwy, Pompano Beach FL (Yelp) · 2091 NE 36th St #5208, Lighthouse Point FL (BBB) · 2071 NE 1st Ave, Pompano Beach FL 33060-4901 (ZoomInfo / Dun & Bradstreet) · plus a HomeAdvisor listing showing ZIP 33066 . Hours also conflict: Mon–Fri 9–5 on Yahoo Local and HomeAdvisor vs Mon–Fri 8–5 on Yelp.

WHY IT HURTS

NAP consistency is one of the strongest ranking factors in Google's local algorithm. When Google finds five versions of a business's address, it lowers confidence in all of them — which directly suppresses map-pack placement. For a home-services business, the map pack *is* the lead source. This alone can be the difference between three-pack placement and page two.

THE FIX Establish one canonical NAP record. Audit and correct the top 40–60 citation sources, in priority order: Google Business Profile, Apple Business Connect, Bing Places, BBB, Yelp, Angi, HomeAdvisor, Facebook, Yahoo, then aggregators (Data Axle, Foursquare, Neustar). Publish the canonical NAP on-site in structured data and in the footer of every page.

TIMELINE Week 2–6. Aggregator propagation runs 60–90 days.

C-04 Duplicate directory profiles are splitting reviews and confusing Google

CRITICAL

EVIDENCE Two separate HomeAdvisor profiles exist (ID 73845684 and ID 109964797 , the latter under ZIP 33066). BBB carries the business under both a Lighthouse Point and a Pompano Beach profile URL. Yelp lists a third address.

WHY IT HURTS

Duplicate listings divide review counts, so a business with genuinely strong ratings looks thinner than it is on every platform. Duplicates are also the single most common cause of Google Business Profile suspension — a risk that turns an SEO problem into a total loss of map visibility overnight.

THE FIX Claim every profile, merge or request removal of duplicates, and consolidate reviews onto the surviving listing where the platform allows it. Then lock the canonical record in.

TIMELINE Week 2–8. Platform merge requests are the long pole.

C-05 No service pages and no location pages on the primary domain

CRITICAL

EVIDENCE Indexed pages found on theroofoxperts.com are limited to the homepage, /about-us , /financing , and /project-photo-gallery . There is no page for roof replacement, roof repair, tile roofing, metal roofing, flat/TPO commercial roofing, roof inspections, or storm and insurance-claim work — and no page for any of the fifteen cities in the stated service area. The service pages that do exist are on the wrong domain (trx.company).

WHY IT HURTS

Google ranks pages, not businesses. A search for "roof replacement Fort Lauderdale" needs a page about roof replacement in Fort Lauderdale to rank for it. With four thin pages, the site is eligible for essentially one query — its own brand name — which only captures people who already know the company. Every competitor named in this report runs a service × location page matrix. That is the entire game in this vertical.

THE FIX Build the matrix: 8–10 service pages × 8–15 city pages, each with genuinely local content (permit and HVHZ code specifics, local project photos, neighborhood references, city-specific testimonials), properly interlinked and schema-marked. Not doorway pages — substantive pages that earn the ranking.

TIMELINE Week 3–16, released in waves. This is the primary traffic driver.

High-Priority Findings

Issues that cap the ceiling on how much traffic the site can earn.

H-01 Title tags are duplicated, non-descriptive, and missing geography

HIGH

EVIDENCE Homepage title is "The Roof Xperts" — brand only, no service, no city. /financing also titles as "THE ROOF XPERTS" , a duplicate carrying no information about the page. /about-us titles as "Best Roofing Company Near Me - THE ROOF XPERTS" — a generic keyword phrase stuffed onto the one page that should be building trust, not chasing traffic. /project-photo-gallery titles as "Project Photo Gallery" with no brand and no geography at all.

WHY IT HURTS

The title tag is still the single highest-leverage on-page ranking element and the primary driver of click-through rate from search results. Duplicates force Google to choose between pages. A homepage title with no service and no city cannot rank for a service-and-city query.

THE FIX A consistent title formula across the site: Primary Service in City | Differentiator | Brand , each unique, each under ~60 characters. Example homepage: "Roof Replacement & Repair in Pompano Beach, FL | Licensed 30+ Yrs | The Roof Xperts". Same treatment for meta descriptions, written as ad copy with financing and free-estimate offers.

H-02 No content engine — zero topical authority

HIGH

EVIDENCE No blog, resource section, cost guide, FAQ hub, or case-study library found on either domain.

WHY IT HURTS

Roofing buyers research for weeks before they call. The queries they run — "how much does a roof cost in Broward County," "will insurance cover my roof," "how long does a tile roof last in Florida," "what is HVHZ certification" — are where the relationship starts. Competitors are capturing that entire research phase. You are not in it. Topical content is also how a domain earns the authority to rank its commercial pages.

THE FIX A South Florida-specific content program: roof cost guides by material and city, the insurance-claim process in Florida, hurricane preparation and post-storm inspection, HVHZ and Florida Building Code explainers, material comparison guides. Each one internally links to the matching service and city page.

H-03 Credentials and experience are not surfaced where Google reads them

HIGH

EVIDENCE Licenses CGC1536478 and CCC1331579 and the 30-year operating history appear in third-party directories and on Instagram, but do not appear in any indexed title tag, meta description, or search snippet for the website. No manufacturer certification (GAF, Owens Corning, CertainTeed), workmanship warranty, or insurance verification found in indexed content.

WHY IT HURTS

Roofing is a Your-Money-Your-Life category — Google applies elevated experience, expertise, authoritativeness, and trust standards to it. Meanwhile the top-ranking competitors lead with exactly these signals: "GAF Platinum Elite," "HVHZ-certified," "employee-owned since 1983." You hold real credentials and are not getting a single point of credit for them.

THE FIX Surface licenses in the site footer, on every service page, and in structured data. Build a dedicated credentials/warranty page. Pursue manufacturer certification if not already held — it is a ranking signal, a trust signal, and a margin signal simultaneously.

H-04 Excellent reviews, fragmented and stranded off-site

HIGH

EVIDENCE 4.9 on Angi · 4.9 on HomeAdvisor · 5.0 on Yelp · BBB-accredited since 2019 — spread across at least seven platforms including two duplicate HomeAdvisor profiles. No consolidated review display or Review schema found on the website. Google review volume could not be confirmed and appears thin relative to competitors.

WHY IT HURTS

Google review count and velocity are among the strongest map-pack ranking factors, and they are the first thing a homeowner checks. Reviews scattered across seven platforms with no on-site aggregation means the social proof never reaches the person on your website, and never reaches the algorithm ranking your map listing.

THE FIX Install an automated review-request system (SMS and email, triggered on job completion) pointed primarily at Google. Aggregate and display reviews on-site with Review and AggregateRating schema. Target a steady, sustainable cadence rather than a burst — velocity matters more than a one-time spike.

H-05 No structured data — ineligible for rich results

HIGH

EVIDENCE No schema-driven rich results (star ratings, FAQ expansions, breadcrumbs, business panels) observed in any search result for either domain.

WHY IT HURTS

Schema is how you tell Google explicitly what the business is, where it operates, what it charges, and how it is rated — rather than hoping the crawler infers it. It also earns visual real estate in search results that measurably lifts click-through rate against competitors on the same page.

THE FIX Full implementation: `RoofingContractor` / `LocalBusiness` with canonical NAP, geo coordinates, hours, and service area; `Service` on every service page; `FAQPage` ; `Review` and `AggregateRating` ; `BreadcrumbList` ; `ImageObject` on gallery projects.

H-06 Thin brand and social signal

HIGH

EVIDENCE Instagram @theroofxperts: 213 followers, 87 posts. No evident content pipeline feeding the website.

WHY IT HURTS

Roofing is one of the most visually persuasive trades there is — before/after work sells itself. Low brand search volume and a thin social footprint also weaken the brand-authority signals Google uses as a tiebreaker between similarly optimized local competitors.

THE FIX Systematize job-site capture (every crew, every job, same shot list), then run one pipeline into Instagram, Google Business Profile photo posts, and on-site project case studies simultaneously. One capture, three placements.

Medium-Priority & Conversion Findings

Not ranking blockers — but each one is money left on the table.

M-01 Palm Beach phone number on a Broward-marketed business

MEDIUM

EVIDENCE Listed number is (561) 740-5516 . The 561 area code covers Palm Beach County; the business address and the bulk of the claimed service area are Broward County (954).

WHY IT HURTS

South Florida homeowners read area codes as a proxy for "are you actually local to me." A Pompano Beach or Fort Lauderdale customer seeing a 561 number reads it as an out-of-area contractor, which costs calls at the exact moment of decision.

THE FIX Add a 954 tracking number as the primary display number in Broward-targeted content and the Google Business Profile, keeping 561 for Palm Beach targeting. Route both to the same line. This doubles as call-attribution data, so you can finally see which pages and which cities actually produce phone calls.

M-02 100% financing — your strongest offer — is buried

MEDIUM

EVIDENCE 100% roof financing is offered, but appears only on a standalone /financing page whose title tag does not even mention financing.

WHY IT HURTS

Cost is the number one objection in a \$10,000–\$16,000 purchase. "No money down, monthly payments" removes it. An offer that strong belongs in the hero of every page, in every meta description, and in the Google Business Profile — not on a page nobody navigates to.

THE FIX Elevate financing into the homepage hero, every service-page CTA, and meta descriptions site-wide. Add a payment calculator — high-engagement, highly linkable, and it pre-qualifies leads before your estimator spends a drive on them.

M-03 Google Business Profile appears unoptimized

MEDIUM

EVIDENCE No GBP-driven rich signals surfaced in search results; NAP conflicts (C-03) and duplicate listings (C-04) indicate the profile is not actively managed.

WHY IT HURTS

For a local roofer, the Google Business Profile typically drives more inbound calls than the website itself. An unmanaged profile — no service list, no products, no weekly posts, no Q&A seeding, no geotagged photo cadence, no review responses — forfeits the highest-intent traffic available.

THE FIX Full optimization pass, then an ongoing cadence: weekly posts, monthly geotagged project photos, complete service and product listings, seeded Q&A, and a response to every review within 48 hours.

M-04 No storm-damage or insurance-claim content

MEDIUM

EVIDENCE No indexed content addressing hurricane damage, emergency tarping, or the Florida roof insurance-claim process on the primary domain.

WHY IT HURTS

In South Florida this is the highest-intent, highest-margin traffic that exists, and it spikes hard and fast after every named storm. Contractors who have the pages already indexed capture it; contractors who start writing after landfall do not. Being unprepared here costs an entire season.

THE FIX Build an evergreen storm hub now — emergency tarping, post-storm inspection checklists, the claim process step by step, working with adjusters, deductible and Florida statute explainers — so it is aged and indexed before the next event, with pre-built landing pages ready to activate.

M-05 Photo gallery is not working as an SEO asset

MEDIUM

EVIDENCE A `/project-photo-gallery` page exists but appears to be a single undifferentiated page rather than individual, indexable project pages.

WHY IT HURTS

Completed jobs are the best long-tail ranking asset a contractor owns. "Tile roof replacement in Coral Springs" as its own case study — with the city, the material, the problem, the solution, the timeline, and the customer's own words — ranks for queries no competitor is even targeting, and converts far better than a photo grid.

THE FIX Convert the gallery into individual project pages, each tagged by city and material, each with ImageObject schema, each internally linked to the matching service and city page. Ten jobs a month becomes 120 new ranking assets a year.

Requires Direct Crawl to Confirm

Deliberately not asserted as findings. These are measured in Discovery, in week one.

As disclosed in Section 02, this audit was produced without direct HTTP access to the site. The items below are the standard technical layer of a full audit. Based on the site's structure and the issues already confirmed, we expect a meaningful number of them to be problems — but they are listed as open questions rather than findings, because asserting them without measurement would be guesswork, and guesswork is not what this report is for.

AREA	WHAT GETS MEASURED	EXPECTATION
Core Web Vitals	Largest Contentful Paint, Cumulative Layout Shift, Interaction to Next Paint — field and lab data, mobile and desktop	LIKELY FAIL
Mobile usability	Viewport config, tap-target sizing, readable font sizes, mobile navigation and click-to-call behavior	AT RISK
HTTPS & redirects	Certificate validity, HTTP → HTTPS enforcement, www vs non-www canonicalization, redirect chains and loops, trailing-slash consistency	AT RISK
robots.txt & sitemap	Presence, correctness, accidental blocking of CSS/JS or key directories, XML sitemap completeness and submission status	AT RISK
Canonicalization	Canonical tag presence and accuracy, duplicate URL parameters, index bloat, orphaned pages	AT RISK
Heading structure	H1 presence and uniqueness on every page, logical H2/H3 hierarchy, keyword alignment	LIKELY FAIL
Image optimization	File weight, next-gen formats (WebP/AVIF), lazy loading, descriptive alt text — critical on a photo-gallery site	LIKELY FAIL
Internal linking	Click depth from homepage, anchor-text distribution, orphan detection, link equity flow	LIKELY FAIL
Broken links / errors	Full 404, 500, and soft-404 sweep across both domains; broken outbound links	AT RISK
Analytics & tracking	Google Search Console verification and coverage, GA4 installation, conversion and event tracking, call tracking, form submission tracking	LIKELY MISSING
Backlink profile	Referring domain count and quality, anchor-text profile, toxic-link exposure, competitor gap analysis	LIKELY THIN
Accessibility	WCAG 2.1 AA pass — contrast, focus states, form labels, alt text. Also an ADA litigation exposure issue for Florida businesses.	AT RISK

AREA	WHAT GETS MEASURED	EXPECTATION
Security & platform	CMS and plugin versions, known vulnerabilities, malware and spam-injection scan, hosting performance and TTFB	AT RISK

Why "likely fail" on so many rows

Two signals drive that expectation. First, a site that never had its WordPress default title changed has almost certainly never had an image pipeline, a heading audit, or a Core Web Vitals pass either — these failures cluster. Second, a four-page site with no internal link layer cannot distribute link equity by definition. We will measure rather than assume, and you will get the actual numbers in week one.

The First 90 Days

Sequenced so the fastest-compounding fixes land first.

PHASE	WORK	OUTCOME YOU CAN SEE
Weeks 1–2 Discovery & triage	Full technical crawl and Section 05 verification · Google Search Console and GA4 setup with conversion tracking · baseline rank and traffic snapshot · domain consolidation plan · trx.company 301 redirect map executed (C-01, C-02) · keyword and competitor gap research	Real baseline numbers. Brand no longer split across two domains. Placeholder content out of search results.
Weeks 2–6 Foundation	NAP canonicalization and citation cleanup across 40–60 sources (C-03) · duplicate listing merges and removals (C-04) · Google Business Profile full optimization · new site build: architecture, design, core service pages · title and meta rewrite site-wide (H-01) · schema implementation (H-05) · Core Web Vitals and mobile pass	Map-pack movement typically begins here. Site loads fast, converts, and tells Google exactly what the business is.
Weeks 6–10 Expansion	Service page matrix completed (C-05) · first wave of city pages launched · credentials and warranty pages live (H-03) · review generation system deployed (H-04) · financing elevated site-wide and payment calculator live (M-02) · project pages converted from gallery (M-05)	The site becomes eligible for hundreds of queries instead of one. Review velocity starts climbing.
Weeks 10–16 Authority	Content engine running (H-02) · storm and insurance-claim hub built ahead of season (M-04) · remaining city pages · link acquisition begins · 954 tracking number deployed (M-01) · conversion-rate testing on primary landing pages	Organic traffic growth becomes measurable and compounding. Attribution finally shows which pages produce calls.

Setting the expectation honestly

Local SEO is not a 30-day business. Realistic timeline for a domain in this condition:

- **Days 1–45:** technical and citation fixes land. Map-pack position and impression volume usually move first — often meaningfully, because C-03 and C-04 are actively suppressing you right now.
- **Days 45–120:** new service and city pages begin ranking and accumulating impressions. First consistent organic lead flow.
- **Days 120–270:** content and links compound. This is where the program starts clearly paying for itself.
- **Day 270+:** defensible position. Competitors have to spend serious money to displace you.

Anyone promising page-one rankings in 30 days is selling you something they cannot deliver. The compounding is real, but it takes the time it takes.

What Comes Next

The order to attack this in, and how we work.

Priority order

If nothing else in this report gets acted on, act on the first row. The two domain issues are costing you compounding authority every day they stay live, and both are resolvable inside a week.

PRIORITY	WORK	FINDINGS
Fix now Week 1–2	Consolidate the brand onto one domain and redirect the second. Remove the placeholder WordPress content from search results. Stand up Search Console and analytics so there is a real baseline to measure against.	C-01C-02
Fix next Week 2–8	Canonicalize the business address and hours across every directory Google reads. Merge or remove the duplicate listings before they trigger a profile suspension. Fully optimize the Google Business Profile.	C-03C-04M-03
Build Week 3–16	Rebuild the site around a real service and location page structure. Rewrite every title and description. Implement structured data. Surface the licenses, the 30-year history, and the financing offer where both Google and buyers can see them.	C-05H-01H-03H-05M-02
Compound Month 3 onward	Run the content engine, build the storm and insurance-claim hub ahead of season, systematize review generation, convert completed jobs into individual project pages, and begin earning links.	H-02H-04H-06M-04M-05

How We Work

The terms of engagement, before any scope conversation.

ITEM	COMMITMENT
Ownership	You own the domain, the hosting account, the website, all content, and every analytics and Google property. No hostage arrangements — if we part ways, you keep everything.
Reporting	Live dashboard access plus a written monthly report covering rankings, traffic, calls, form fills, and work completed. You see what was done and what it produced.
Measurement	Call tracking and conversion tracking go in before the work starts, so growth is attributable to specific pages and cities rather than asserted.
What we do not do	Guarantee rankings, buy links, build doorway pages, or use any tactic that risks a manual action on your domain.
Honest timelines	Local SEO is not a 30-day business. Expect map-pack and impression movement in the first 45 days, first consistent organic lead flow by day 120, and a defensible position after month nine.

Next step

A 30-minute call to walk through these findings, answer questions, and schedule the Discovery crawl that converts Section 05 from expectations into measured numbers. Scope and investment options follow separately, once we have agreed on what actually needs building.

Evidence sources: Google search index · Better Business Bureau · Yelp · Angi · HomeAdvisor · Yahoo Local · BuildZoom · ZoomInfo · Dun & Bradstreet · city-data business registry · Florida DBPR licensing records · Instagram. Audit conducted September 11, 2026. Technical performance items in Section 05 pending direct crawl.
